

TROPIC TO HATCH TRANSMISSION LINE

GARKANE ENERGY

Hatch, Utah

Scope

Transcon assisted with NEPA Compliance Activities.

Project Description

Transcon Environmental assisted in the production of an Environmental Impact Statement by conducting cultural and biological resource surveys for the various proposed alternatives. Using the data collected in the field, Transcon produced a Class III Cultural Resource Report, a series of technical reports on biological resources, water resources, visual resources, and land use as well as a Biological Assessment. Transcon assisted with public scoping activities by coordinating public meeting and consulting with appropriate parties.

Garkane Energy has proposed to build a 138kV transmission line in order to replace their existing 69kV transmission line due to a substantial increase in electricity usage in the area. The proposed line is approximately 31 miles in length and will involve the expansion of an existing substation as well as the construction of a new substation.

Agency Coordination

Bureau of Land Management, US Fish and Wildlife, Utah State Historic Preservation Office, Dixie National Forest, Bryce Canyon National Park, Utah Trust Lands, and private land holders.
